

# UNOFFICIAL X32/M32 OSC REMOTE PROTOCOL

**OSC protocol implementation for the  
X32/M32 Digital Mixing Console families**  
Applies to console FW ver 4.0 and later

Initiated from version 1.01 (Oct-17-2012)  
version 4.06 – 01 (Mar 12, 2021)

## Acknowledgements

This document regroups data contained in version 1.01 of the OSC protocol for the X32 family of products released by Behringer in Oct. 2012, and a large number of additional OSC messages for communicating with the X32, their syntax and use, along with practical examples and explanations as to how and in which context they should be used. This document should also apply to M32, a product from Midas, very similar to X32.

Behringer is not associated to the redaction of this document and no support will be provided by the company.

I have tried to make the information contained here as accurate as possible. A few areas are still prone to inaccuracies or uncertainties as to how to best use them. Please do not hesitate to provide feedback on the X32 user forum on errors or inaccuracies. They will be corrected in futures updates.

I want to thank X32 forums well known **Paul Vannatto** for his invaluable support, generous time and advice in reviewing early versions of this document.

As you read through this document, you may like a “hands on” experience with testing OSC commands, it is recommended you use a utility to send/read commands to/from the X32. Such utilities ensure the commands will be properly formatted and offer better support for reading OSC data back from X32/M32.

**x32\_Command**<sup>1</sup> is a terminal based utility running on Windows, Linux, OSX and Raspberry platforms, supporting batch and interactive modes, timed commands, multi-tag parameters, and also scenes, snippets, and presets. Download it from <https://sites.google.com/site/patrickmaillot/x32>.

**x32 Live Toolbox**<sup>2</sup> is a GUI based utility running in Windows, Linux and OSX. It also offers additional features such as EQ copy. Download it from <http://sourceforge.net/projects/x32livetoolbox/>

With my purchase of an X32 digital mixer and as I started to find out more about OSC and ways to achieve more with the X32 via programs, I have spent quite some time designing and coding several utilities and applications for the M/X32 family of systems. Late 2015, I decided to open-source the code for the programs I wrote. These can be found at <https://github.com/pmaillot/X32-Behringer>. I'll continue to add programs as I finally “clean” them before publishing.

Note: Starting with X32 FW release 4.0, this manual will follow the X32 FW release numbering rather than its own numbering scheme; For example, “*version 4.02 – 01 (Jan 12, 2020)*” refers to update 01 of the document for FW 4.02, issued on Jan 12<sup>th</sup>, 2020.

## DESCRIPTION

X32 & M32 represent a family of digital mixers (Core<sup>3</sup>, Rack, Producer, Compact and Standard) which are using a communication protocol that is compatible to standard OSC with some MUSIC Group specific extensions (e.g. parameter enquiry, subscriptions). OSC packets are received on **UDP port 10023** and replies are sent back to the requester's IP/port<sup>4</sup>.

MIDI is also supported by the console and this is addressed later in this document, although the main focus hereafter is on OSC, using faster ethernet connections.

In the following, the X32/M32 (rack, console) is also called server, and a connected device or application is typically called client. Connections to the server take place over Ethernet network, UDP port 10023. The server replies on the UDP port used by the client when establishing communication.

Due to the nature of UDP communications, buffer overflows situations should be taken into consideration. A typical example of critical situation is sending large numbers of `/node` requests to an X32 connected to a 2.4GHz/54Mb/s WIFI router. The 100Mb/s link between the X32 and the router will enable the X32 to send a lot more data than what can be propagated via WIFI by the router to connected clients, with possibly missing data at the client level due to UDP packets being silently lost by the router. Indeed, no errors will be reported in UDP for loss of data.

There are different modes of operation for the X32/M32 to communicate OSC protocol:

- **Immediate:** a client such as a network connected tablet or PC application sends a request with or without parameters and the server immediately acts or replies with the respective data.  
*Note:* a single request from the client can result in several replies from the server (this is typically the case with `/showdump`)
- **Deferred:** a client such as a network connected tablet or PC application sends a specific request without parameters (`/xremote`). When changes take place either from the server UI or from a connected client, several notification messages are returned for a period of time, until a timeout is reached.  
*Note:* a single action at the server can result in several messages from the server.

X32 internal variables are driving the behavior of the console. These can be read (Get) or written (Set) with OSC commands mapping variables with addressable parameters. Parameters are internally organized in logical groups, I will refer to as “**X32nodes**”. X32nodes are widely used in scenes, snippets, and presets. They can be read using the `/node` command presented later in this document<sup>5</sup>. X32nodes can be written or sent to X32 using the `/` command, also presented later in this document. Parameters of an X32node can also be updated as a group (complete or not) by using the combined (multiple Type Tags) form of OSC Set commands.

---

<sup>3</sup> The X32 Core has been discontinued during the 4<sup>th</sup> quarter of 2017

<sup>4</sup> See Appendix for an example of communication program

<sup>5</sup> See chapter “X32nodes (`/node` & `/`) commands”

The list of <OSC Address Pattern> parameters commands, enabling an interactive control of all features of the X32/M32 mixer family is listed below:

<OSC Address Pattern> :=

```
/ | /-action | /add | /auxin | /batchsubscribe | /bus | /ch | /config |  
/copy | /dca | /delete | /formatsubscribe | /fx | /fxrtn | /headamp |  
/info | /-insert | /-libs | /load | /main/m | /main/st | /meters | /mtx |  
/node | /outputs | /-prefs | /rename | /renew | /save | /-show | /showdump |  
/-stat | /status | /subscribe | -undo | /unsubscribe | /-urec | /-usb |  
/xinfo | /xremote
```

In this document, many commands to X32/M32 and replies from the console are shown as text in the following forms:

<command> <format> <parameters>

Or

<command>~~~<format>~~~<parameter> <parameter>...

The first form, for example: `/ch/01/mix/fader ,f [0.7]` represents a command you would type in, using the **X32\_Command** utility mentioned earlier in this document.

The second form, for example: `/ch/01/mix/fader~~~~,f~~[0.7]` represents a command sent by the X32\_Command utility mentioned earlier in this document. In that case, the number of ~ characters accurately represent the number of Null bytes (or \0) sent along with the command to respect the OSC protocol format.

This is further detailed in the coming pages.

## Client initiated messages (client → X32 console)

| Operation                  | OSC address           | Parameters   | Comments   |
|----------------------------|-----------------------|--|--|
| Info request               | /info<br>/xinfo       | None   | Server responds with <i>/info</i> message<br>Server responds with <i>/xinfo</i> message  |
| Status request             | /status               | None   | Server responds with <i>/status</i> message  |
| Set X32 parameter          | <OSC Address Pattern> | <string   int   float   blob value>  | Sets the value of a console parameter, e.g.:<br><i>/ch/01/mix/fader~~~~,f~~&lt;float&gt;</i><br>If it exists and value is in range, the new value takes place in the X32.  |
| Get X32 parameter          | <OSC Address Pattern> | None   | Requests the value of a console parameter, e.g.<br><i>/ch/01/mix/fader~~~~</i><br>If it exists, the current value is echoed back by server, e.g.:<br><i>/ch/01/mix/fader~~~~,f~~&lt;float&gt;</i>  |
| Set X32 node data          | /                     | <string>   | Updates the values of a set of console parameters. A full set of X32node values can be sent to the server as plain text and matching <i>/node</i> formats, e.g.:<br><i>/~~~,s~~~-prefs/iQ/01 none Linear 0~~</i>   |
| Get X32 node data          | /node                 | <string>   | Requests the values of a set of console parameters, e.g.:<br><i>/node~~~,s~~~-prefs/iQ/01~~~~</i><br>The current values for the full set corresponding to the request are returned by the server in plain text (string of characters, ending with a linefeed), e.g.:<br><i>node~~~,s~~/-prefs/iQ/01 none Linear 0\n~~~~</i>  |
| Get X32 meters             | /meters               | <string><br><optional int: chn_meter_id><br><optional int: grp_meter_id><br><optional int: priority> | Results in regular updates meter values as a single binary blob. Timeout is 10 seconds, e.g.<br><i>/meters ,s meters/1</i> will return bursts of 96 float meter values (32 input, 32 gate and 32 dynamic gain reductions) for 10s.<br>see “Meter requests” for additional details  |
| Subscribe to data from X32 | /subscribe            | <string> < optional int>   | Client describes to X32 server what information it is interested in receiving, and at which frequency the update is reported, until a timeout of 10 seconds is reached.eg:<br><i>/subscribe ,s /-stat/solosw/01</i><br>or<br><i>/subscribe ,si /-stat/solosw/01 1</i><br>Will report about 200 updates of the state of solo switch for channel 01 over the span of 10s.<br><i>/subscribe ,si /-stat/solosw/01 50</i><br>Will report about 4 updates of the state of solo switch for channel 01 |
| Subscribe to data formats  | /formatsubscribe      | <string>...<string><int>...<int>   | Client describes to X32 server what information it is interested in receiving, e.g.:<br><i>/formatsubscribe ,ssiii /mfm_c /dca/* /on 1 8 8</i>   |

|                                     |                 |                                  |  |
|-------------------------------------|-----------------|----------------------------------|--|
| from server                         |                 |                                  | Reports a blob of 36 bytes for about 10s.<br>The last <int> specifies the frequency factor of the report.  |
| Subscribe to batch data from server | /batchsubscribe | <string>...<string><int>...<int> | Client request from X32 server data to receive, e.g.:<br><code>/batchsubscribe ,ssiii /x_meters_0 /meters/0 0 69 1</code><br>Reports a blob of 70 floats for about 10s.<br><code>/batchsubscribe ,ssiii /x_meters_8 /meters/8 0 5 1</code><br>Reports a blob of 6 floats for about 10s.<br><code>/batchsubscribe ,ssiii /mfm_a /mix/on 0 63 8</code><br>Reports a blob of 276 bytes for about 10s.<br>The last <int> specifies the frequency factor of the report. |
| Renew data request                  | /renew          | <string>                         | Requests renewing of data described in <string>, e.g.<br><code>/renew~~,s~~meters/5~~~~</code><br><code>/renew~~,s~~hidden/states~~</code>   |
| Register for updates                | /xremote        | None                             | Triggers X32 to send all parameter changes to maximum four active clients. Timeout is 10 seconds, e.g. the <code>/xremote</code> command has to be renewed before this delay in order to avoid losing information from The X32 console.  |

## Multiple client management

A single X32 can manage updates from and to several simultaneous UDP clients.

In order to keep being synchronized with changes happening at the X32 level, either from a change at the desk itself or requested by another remote client, each client must register for receiving updates from the X32. This is possible with the `/xremote` command.

After receiving an `/xremote` command, the X32 will update the client with changes taking place in the X32, such as fader movements, bank change requests, and screen updates. Some changes or user actions will not be reported as they do not directly affect the connected clients or result in changes that are strictly local to the X32/M32, such as pressing on one of the view buttons of the Standard X32/M32.

Registering for desk updates with a `/xremote` command maintains updates for 10 seconds, after which a new `/xremote` command should be issued by the client to keep the updating process alive.

Please refer to the examples given at the end of this document on how to use `/xremote` in client applications (for example X32Saver.c (Linux or Windows), X32 data echo in Go)

Note: other commands such as `/subscribe`, `/formatsubscribe`, `/batchsubscribe` also enable receiving regular updates from the server; details are available in the paragraph “Subscribing to X32/M32 Updates”.

## Server replies or server initiated messages (X32 console → client)

| Operation       | OSC address           | Parameters  | Comments   |
|-----------------|-----------------------|---|--|
| Info request    | /info                 | <string server_version><br><string server_name><br><string console_model><br><string console_version>   | Returns names and version numbers, e.g. :<br><i>/info~~~,ssss~~~V2.05~~~osc-server~~X32C~~2.08~~~</i><br>(~ stands for null character)   |
|                 | /xinfo                | <string network address><br><string network name><br><string console_model><br><string console_version> | <i>/xinfo~~,ssss~~~192.168.1.62~~~X32-02-4A-53~~~X32~3.04~~~</i>   |
| Status request  | /status               | <string state><br><string IP_address ><br><string server_name >   | Returns console status and IP , e.g. :<br><i>/status~,sss~~~active~~192.168.0.64~~~osc-server~~</i><br>(~ stands for null character)   |
| Console changes | <OSC Address Pattern> | <string   int   float>  | If <i>/xremote</i> is active, the X32 console echoes the value of a console parameter in response to a set command from another client or X32 parameter change, e.g.<br><br><i>/-stat/solosw/01~~~,i~~[1]</i><br><i>/-stat/solo~,i~~[1]</i><br><i>/ch/01/mix/01/pan~~~,f~~[1.0000]</i> |

## X32/M32 OSC Protocol Parameters

The table below lists the type and associated characteristics of parameters used for <OSC Address Pattern> and X32node commands.

|         |        |   |
|---------|--------|---|
| types → |        | [string, enum(integer), int(integer), linf(float), logf(float), level(float), bitmap(integer)]<br>All data is on 4 bytes or multiples of 4 bytes  |
| range → | string | A string of characters padded to a multiple of 4 with \0 (null) characters  |
|         | enum   | An int corresponding to an element in a [list of all possible strings]  |
|         | int    | An int with value in [min. value, max. value], step size = 1  |
|         | linf   | A float with value in [min. value, max. value, step size], following a linear scale   |
|         | logf   | A float with value in [min. value, max. value, steps], following a log scale  |
|         | level  | A float with value in [-90.0...10.0 (+10 dB), steps]:<br>4 'linear' dB ranges:<br>0.0...0.0625 (-∞, -90...-60 dB),<br>0.0625...0.25 (-60...-30 dB),<br>0.25...0.5 (-30...-10dB) and<br>0.5...1.0 (-10...+10dB)<br>(see conversion help in appendix) |
|         | %int   | An int corresponding to the bitwise OR of multiple bits (0 or 1)  |

## Type rules (Get/Set parameter) and data formatting

With very few exceptions (clearly mentioned in this document when needed), the X32/M32 follow the guidelines as set by the Open Sound Control (OSC) 1.0<sup>6</sup>, implementing the 4 basic OSC type tags for int32, float32, string, and blob.

- all parameters must be big-endian and 4-byte aligned/padded, as per OSC specification.
- padding is done with null bytes.
- float parameters must be in range 0.0 – 1.0, e.g.:
  - `0.0` → `0x00000000` (big-endian)
  - `0.5` → `0x3f000000` (big-endian)
  - `1.0` → `0x3f800000` (big-endian)
- integer and float parameters are signed 32-bit values.
- strings must be null-terminated.
- enum parameters can be sent as strings or integers (see below).
- boolean parameters will map to enum type `{OFF, ON}` (or OSC integer `{0, 1}`)
- blobs (arbitrary binary data) follow specific rules depending on the section they apply to (see later in this document)

An OSC command typically consists in a 4-byte padded OSC message, followed by a 4-byte padded type tag string, and if a non-empty type tag string is present, one or more 4-byte aligned/padded arguments.

The OSC 1.0 specification mentions that older implementations of OSC may omit the OSC type tag string, and OSC implementations should be robust in the case of a missing OSC type tag string, which is the case of X32/M32 systems.

### Examples:

A simple OSC command, with no tag string and no arguments:

`/info~~~,~~~` correct format (OSC 1.0 compliant) command

The following will also work

`/info~~~` non OSC 1.0 compliant command, but accepted as older form of OSC

And the reply from different X32 or M32 systems (FW and SW versions may vary):

X32 Standard: `/info~~~,ssss~~~V2.05~~~osc-server~~X32~2.12~~~~`

X32 Rack: `/info~~~,ssss~~~V2.05~~~osc-server~~X32RACK~2.12~~~~`

X32 Compact: `/info~~~,ssss~~~V2.05~~~osc-server~~X32C~2.12~~~~`

X32 Producer: `/info~~~,ssss~~~V2.05~~~osc-server~~X32P~2.12~~~~`

X32 Core: `/info~~~,ssss~~~V2.05~~~osc-server~~X32CORE~2.12~~~~`

M32 Standard: `/info~~~,ssss~~~V2.05~~~osc-server~~M32~2.12~~~~`

M32 Compact: `/info~~~,ssss~~~V2.05~~~osc-server~~M32C~2.12~~~~`

M32 Rack: `/info~~~,ssss~~~V2.05~~~osc-server~~M32R~2.12~~~~`

Note: Using UDP port 10024 (10023 for X32 family members), the XAir systems will return similar messages, as follows:

XR18: `/info~~~,ssss~~~V0.04~~~XR18-1D-DA-B4~~~XR18~~~~1.12~~~~`

XR16: `/info~~~,ssss~~~V0.04~~~XR16-1D-DA-B4~~~XR16~~~~1.12~~~~`

XR12: `/info~~~,ssss~~~V0.04~~~XR12-1D-DA-B4~~~XR12~~~~1.12~~~~`

---

<sup>6</sup> Please refer to [http:// opensoundcontrol.org/](http://opensoundcontrol.org/) for further information on the OSC full spec.

An OSC command with a single type tag string and argument:

```
/ch/01/config/name~~,s~~name~~~~
```

An OSC command with a more complex tag string and multiple arguments:<sup>7</sup>

```
/ch/01/eq/1 ,ifff [2] [0.2650] [0.5000] [0.4648]
```

This is equivalent to the following 4 simpler commands:

```
/ch/01/eq/1/t~~~,i~~[ 2]
/ch/01/eq/1/f~~~,f~~[0.2650]
/ch/01/eq/1/g~~~,f~~[0.5000]
/ch/01/eq/1/q~~~,f~~[0.4648]
```

Or in hexadecimal for the last command:

```
/ c h / 0 1 / e q / 1 / q ~ ~ ~ , f ~ ~ [ 0 . 4 6 4 8 ]
2f63682f30312f65712f312f710000002c6600003eedfa44
```

Where `3eedfa44` is the hex for a 32bit float, big endian representation of `0.4648`, and where `~` stands for null character (`\0`)

### Responses from X32/M32:

Sending to port 10023 the UDP request `/info~~~~,~~~` to a standard X32 will be replied with 48 bytes back to the sender's UDP port:

```
/info~~~,ssss~~~V2.05~~~osc-server~~X32~2.10~~~~
```

Sending to port 10023 the UDP request `/status~,~~~` will be replied with 52 bytes back to the sender's UDP port:

```
/status~,sss~~~~active~~192.168.0.64~~~~osc-server~~
```

Sending to port 10023 the UDP request `/fx/4/par/23~~~~,~~~` will be replied with 24 bytes back to the sender's UDP port, for example:

```
/fx/4/par/23~~~~,f~~[float 0.5]
```

or, in hexadecimal:

```
2f66782f342f7061722f3233000000002c6600003f000000
```

### Special considerations for the enum type.

As stated before, enums can be sent as strings or integer; for example, the value of channel 01 gate mode is listed as an "enum" type with possible values of {EXP2, EXP3, EXP4, GATE, DUCK}.

The setting "GATE" can be enabled for channel 01 by sending either one of the following:

```
/ch/01/gate/mode~~~~,s~~GATE~~~~
```

or

```
/ch/01/gate/mode~~~~,i~~[3]
```

in hexadecimal:

```
2f63682f30312f676174652f6d6f6465000000002c7300004741544500000000
```

or

```
2f63682f30312f676174652f6d6f6465000000002c690000000000000003
```

<sup>7</sup> In the case of X32/M32 "node" commands, this only applies to combinations of int or floats (`,i` or `,f`); strings (`,s`) sent to a node address (rather than a parameter address) are interpreted differently (internally used for X32-edit). As a result of such choice, the command `/ch/[01..32]/config ,sii [name] [1] [3] [1]`, although semantically correct and OSC compliant, does not work on X32/M32 when it does work fine on XAIR series.

Please note this only applies to the “enum” type; for example, it does not apply to the key source setting of dynamics which only accepts an “int” value between 0 and 64.

```
/ch/[01...32]/dyn/keysrc
```

**Note:** The X32/M32 only considers a subset of discrete values of the floating-point range [0.0, 1.0], depending on the destination the float value applies to; a number of steps determines the values “known” by X32/M32. Example: In EQ frequencies, applicable values are listed as [20.0, 20k, 201], meaning the frequency range 20Hz to 20kHz is divided into 201 discrete values, and the same applies to the “known” floating point values in the range [0.0, 1.0] used to change or control EQ frequency). An OSC floating point value outside of the known values will be rounded to the nearest known value.

This is particularly useful to convert text to float values when X32/M32 returns data in the form of text, such as with the `/node` commands used in scene and snippets, or when having to send data as text, for example in the case of OSC data sent over MIDI Sysex commands<sup>8</sup>.

Tables in appendix to this document list common cases for frequencies, levels, etc. following a log scale.

### Float type.

In “standard” OSC commands using floating point data parameters, floats are encoded as big endian 32bit floats, with a value between 0.0 and 1.0. For example, a volume variation on channel 01 to 3dB will be sent as follows:

```
/ch/01/mix/fader~~~~,f~~[0.8250]
```

or

```
2f63682f30312f6d69782f6661646572000000002c6600003f5334cd
```

Similarly, a pan change for channel 02 to half right will be set as follows:

```
/ch/02/mix/pan~~,f~~[0.7500]
```

or

```
2f63682f30322f6d69782f70616e00002c6600003f400000
```

What is different in the case of floats is that the X32node-like commands for the commands above will enable setting parameters to their actual range, and not mapped to [0.0 ... 1.0], so for example and the case of the two examples above for volume and pan control, we can actually send the following:

```
/~~~~,s~~/ch/01/mix/fader 3~~
```

or

```
2f0000002c7300002f63682f30312f6d69782f666164657220330000
```

Above: setting volume fader to 3dB; volume range is [-90, +10, 1024], a pseudo log scale from -90dB to +10 dB, in 1024 steps. Below are additional examples for values 10, 0, -5, -90, and -20.5, respectively:

```
/~~~~,s~~/ch/01/mix/fader 10~  
2f0000002c7300002f63682f30312f6d69782f666164657220313000
```

---

<sup>8</sup> See MIDI Connections chapter and appendix pages for section on sending OSC commands over MIDI SYSEX messages

```

/ ~ ~ ~ , s ~ ~ / c h / 0 1 / m i x / f a d e r   0 ~ ~
2f0000002c7300002f63682f30312f6d69782f666164657220300000

or
2f0000002c7300002f63682f30322f6d69782f70616e203530000000

```

Above: setting channel 02 pan to “right, 50% level “; pan range is a linear scale in the range of -100.0 to +100.0 in steps of 2.0

Later in this document, you will find tables of all known X32/M32 OSC commands.

These will contain the format, the parameter type(s) and value range(s) of each possible command:

- Possible *ints*, *%ints*, *enums* and *strings* values are as stated in the parameter ranges.
- For binary *floats*, the data sent to or returned from the X32/M32 is always in the range [0.0 ... 1.0], but the parameter range values will be shown as *level*, *logf*, or *linf* types with the min and max values along with the step or number of steps values, in full text format (ex: [-100.0, +100.0, 2.0]), to help in the case you would prefer to use the X32node style notation to send data to your X32/M32.

## MIDI Connections<sup>9</sup>

This Document is all about OSC over ethernet. Nevertheless, the X32/M32 family of devices can be connected to MIDI and send or receive commands using the MIDI protocol. Some commands are direct (using the standard MIDI controllers, channels and parameters data) and can provide a very simple way to control some of the features of the X32/M32.

Other commands use the MIDI SYSEX standard extensions; Using SYSEX, most (not all) of the X32/M32 OSC commands can be sent over MIDI; This is a major advantage for people who want to control with a finer granularity their device, yet do not have or want to invest in OSC programming. This document then becomes quite useful as OSC commands have to be coded over SYSEX to be sent as MIDI protocol.

The user should not expect the same performance when using MIDI as when using OSC. Indeed, ethernet is a much faster protocol than MIDI, but MIDI has solid advantages such as real-time control, much shorter messages for certain commands, and a very wide acceptance within the Music community, offering a large set of devices that can understand, manipulate and send or receive MIDI.

This document contains several appendix pages explaining:

- The standard, direct MIDI commands understood by X32/M32 systems
- How to code OSC messages within a MIDI SYSEX command

---

<sup>9</sup> See appendix pages for section on sending OSC commands over MIDI SYSEX messages

## Meter requests

The `/meters` OSC command is used for obtaining Meter data, or to get a specific set of meter values. Update cycle frequency for meter data is 50 ms, and may be variable according to console's ability to fulfill requests. Timeout is 10 seconds.

Meter values are returned as floats in the range [0.0, 1.0], representing the linear audio level (digital 0 – full-scale; internal headroom allows for values up to 8.0 (+18 dBfs)).

The typical format for `/meters` is as follows:

```
/meters ,sii <meter request and parameters (see below)> [time_factor]
```

The highlighted `sii` tags are used for the meter request, comprising a string and two ints depending on the meter request type. The command is active for about 10s. Possible meter requests are given in the following pages. The last int of the command is used to control the number of times the requestor will receive meter values.

`time_factor` is a value between 1 and 99 setting the interval between two successive meters messages to  $50ms * time\_factor$ . Any value of `time_factor` outside or [1, 99] is equivalent to 1. For a timespan of 10s, the number of updates can be calculated based on the value of `time_factor` as below:

|                           |                         |
|---------------------------|-------------------------|
| <code>time_factor:</code> | <2 or >99 → 200 updates |
|                           | 2 → 100 updates         |
|                           | [...]                   |
|                           | 40 → 5 updates          |
|                           | 80 to 99 → 3 updates    |

The data returned by the X32/M32 server for `/meters` is an OSC-blob, an arbitrary set of binary data. As a result, the format differs from what is typically returned by the X32/M32. This is essentially for efficiency/performance reasons. The format of a returned blob is as follows:

```
<meter id> ,b~~<int1><int2><nativefloat>...<nativefloat>
```

|                                   |   |
|-----------------------------------|---|
| <code>&lt;meter id&gt;:</code>    | see possible values below (padded with null bytes)          |
| <code>,b~~:</code>                | indicates a blob format, padded with null bytes             |
| <code>&lt;int1&gt;:</code>        | the length of the blob in bytes, 32 bits big-endian coded   |
| <code>&lt;int2&gt;:</code>        | the number of <nativefloats>, 32 bits little-endian coded   |
| <code>&lt;nativefloat&gt;:</code> | data or meter value(s), 32 bits floats, little-endian coded |

### Example:

The following meter request is sent to an X32/M32 server:

```
/meters~,si~/meters/6~~~16
```

Where ~ stands for null character, and "16" is actually sent as a big-endian 32bit integer, i.e. 0x00000010.

```
2f6d6574657273002c7369002f6d65746572732f3600000000000010
 / m e t e r s ~ , s i ~ / m e t e r s / 6 ~ ~ ~ [ 16 ]
```

The X32/M32 server will return for 10 seconds and approximately every 50ms the 4 channel strip meters (pre-fade, gate, dyn gain reduction and post-fade) values of channel 17, in a single blob, as shown in the reply message below:

```
2f6d65746572732f360000002c6200000000001404000000fd1d2137fdff7f3f0000803f6ebbd534
 / m e t e r s / 6 ~ ~ ~ , b ~ ~ [ int1 ][ int2 ][nfloat][nfloat][nfloat][nfloat]
```

## List of all Meter IDs:

### */meters/0*

Returns meter values from the **METERS** page (not used for X32-Edit):

- 32 input channels
- 8 aux returns
- 4x2 st fx returns
- 16 bus masters
- 6 matrixes
- returns 70 float values as single binary blob

### */meters/1*

Returns meter values from the **METERS/channel** page:

- 32 input channels
- 32 gate gain reductions
- 32 dynamics gain reductions
- returns 96 float values as a single OSC blob

### */meters/2*

Returns meter values from the **METERS/mix bus** page:

- 16 bus masters
- 6 matrixes
- 2 main LR
- 1 mono M/C
- 16 bus master dynamics gain reductions
- 6 matrix dynamics gain reductions
- 1 main LR dynamics gain reduction
- 1 mono M/C dynamics gain reduction
- returns 49 float values as a single OSC blob

### */meters/3*

Returns meter values from the **METERS/aux/fx** page:

- 6 aux sends
- 8 aux returns
- 4x2 st fx returns
- returns 22 float values as a single OSC blob

### */meters/4*

Returns meter values from the **METERS/in/out** page:

- 32 input channels
- 8 aux returns
- 16 outputs
- 16 P16 ultranet outputs
- 6 aux sends
- 2 digital AES/EBU out
- 2 monitor outputs
- returns 82 float values as a single OSC blob

*/meters/5 <chn\_meter\_id> <grp\_meter\_id>*

Returns meter values the **Console Surface VU Meters** (channel, group and main meters):

16 channel meters: <chn\_meter\_id> 0: channel 1-16; 1: channel 17-32; 2: aux/fx returns;  
3: bus masters

8 group meters: <grp\_meter\_id> 1: mix bus 1-8; 2: mix bus 9-16; 3: matrixes

2 main LR

1 mono M/C

→ returns 27 float values as a single OSC blob

*/meters/6 <channel\_id>*

Returns meter values from **Channel Strip Meters** (post gain/trim, gate, dyn gain reduction and post-fade):

4 channel strip meters: <channel\_id> channel 0...71]

→ returns 4 float values as a single OSC blob

*/meters/7*

Returns meter values from the **Bus Send** meters:

16 bus send meters

→ returns 16 float values (from Bus sends 1-16) as a single OSC blob

*/meters/8*

Returns meter values from **Matrix Send** meters:

6 Matrix send meters

→ returns 6 float values (from Matrix sends 1-6) as a single OSC blob

*/meters/9*

Returns meter values from **Effect Send** and **Return** meters:

2 effects send and 2 effects return meters for each FX slot (8 slots)

→ returns 32 float values (4 x FX1, 4 x FX2, ... 4 x FX8) as a single OSC blob

*/meters/10*

Used for some **Effects**, for example Dual DeEsser, Stereo DeEsser, Stereo Fair Compressor

→ returns 32 float values

*/meters/11*

Returns meter values from the **Monitor** pages

→ returns 5 float values (Mon Left, Mon Right, Talk A/B level, Threshold/GR, Osc Tone level) as a single OSC blob

*/meters/12*

Returns meter values from the **Recorder** page

→ returns 4 float values (ReInput L, ReInput R, Playback L, Playback R) as a single OSC blob

*/meters/13*

Returns meter values from the **METERS** page

32 input channels

8 aux returns

4x2 st fx returns

→ returns 48 float values

#### **/meters/14**

Used for some **Effects**, for example Precision Limiter, Combinator, Stereo Fair Compressor  
→ returns 80 float values

#### **/meters/15**

Used for **RTA** and some **Effects**, for example Dual GEQ, Stereo GEQ

→ returns 50 32bits values as a single OSC blob.

The 32bits values returned are representing 100 successive *little endian coded short ints*, in the range  $[0x8000, 0x0000]$ ; each short int value provides a floating-point RTA db level in the range  $[-128.0, 0.0]$ , by dividing the short int (converted to float) by  $256.0$ .

For example, a 32bit value of  $008000c0$  will represent two values, the first one being  $0x8000$  (or  $-128.0$  after conversion), and the second one being  $0xc000$  (or  $-64.0$  after conversion). Similarly, a 32bits value of  $40e0ffff$  will represent two successive RTA values of  $-31.75db$  and  $-0.00db$ , respectively.

Note: a short int value of  $0x0000$  (or  $0.0db$ ) means signal clipping occurred.

The 100 short ints (or RTA db values) correspond to frequencies listed in the table (values in Hz) below, respectively.

|        |        |        |        |        |        |        |        |        |        |
|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|
| 20     | 21     | 22     | 24     | 26     | 28     | 30     | 32     | 34     | 36     |
| 39     | 42     | 45     | 48     | 52     | 55     | 59     | 63     | 68     | 73     |

#### **/meters/16**

Used for **comp** and **automix**

→ returns 48 32bits values as a single OSC blob.

The first 44 values are 32bits values returned are representing:

- 32 channel gate gains,
- 32 channel comp gains,
- 16 bus comp gains,
- 6 matrix comp gains,
- 2 (L/R and Mono) comp gains

All data snt as *little endian coded short ints*; each short int value represents a floating-point level in the range  $[0, 1.0]$ , by dividing the short int (converted to float) by  $32767.0$ .

The 4 last floats represent 8 automix (channel 01...08) gains coded on successive shorts as  $\text{Log}_2(\text{value}) * 256$ .

## X32/M32 ↔ Client communications

The following tables (a long list) describe communication messages that can be initiated by the client, by the server as a response to the client or as update data.

### Configuration (/config) data

| <path>  | <type> | <range>   | <unit> |
|---|--------|---|--------|
| config data   |        |   |        |

## Headamp (/headamp) data

| headamp [000...127]          |      |  |    |
|------------------------------|------|--|----|
| /headamp/[000...127]/gain    | linf | $[-12.000, 60.000, 0.500]^{36}$<br>/headamp index:<br>000...031: local XLR inputs<br>032...079: AES50 port A connected devices<br>080...127: AES50 port B connected devices  | dB |
| /headamp/[000...127]/phantom | enum | <i>{OFF, ON}</i> , int with value 0 or 1<br>/headamp index:<br>000...031: local XLR inputs<br>032...079: AES50 port A connected devices<br>080...127: AES50 port B connected devices   |    |
| /-ha/[00...39]/index         | int  | (Read only) returns the actual headamp used as source for a given input [00...39] represent a channel index<br>0...31: channel 01...32<br>32...39: aux 1...8<br>A value of -1 is possible and typically happens when the X32 audio engine routing changes to an internal source such as the card slot. |    |

## Inserts (/insert) data<sup>37</sup>

| insert              |     |   |  |
|---------------------|-----|---|--|
| /-insert/fx[1-8]L   | int | Channel the FX L input[1...8] is inserted into  |  |
| /-insert/fx[1-8]R   | int | Channel the FX R input [1...8] is inserted into |  |
| /-insert/aux[1...6] | int | Channel the Aux input [1...6] is inserted into  |  |

<sup>36</sup> See Appendix section for detailed values

<sup>37</sup> /node ,s -insert reports 22 inserts in the following order: fx1L, fx1R, fx2L, ..., fx8R, aux1, ..., aux6

## Show, Cue, Scene, Snippet, and Preset Management

This section covers the `/showdump`, `/-show`, `/-libs`, `/add`, `/copy`, `/save`, `/load`, `/delete`, and `/rename` commands typically used to manage Show, Cues, Scenes, Snippets and Presets.

The X32/M32 family of products is capable of handling a single show at a time.

A show is made of a list of Cues, referencing Scenes and Snippets. A show can contain up to 100 distinct cues. Cue numbering consists of 3 numbers in the form xxx.x.x to offer a hierarchy scheme. Cues can also have a flag to skip them at read/execute time.

X32/M32 systems can manage 100 different Scenes and 100 different Snippets, each numbered 0 to 99. Scenes files consist in a large collection of data resulting from and with a similar format as the output of `/node` commands. Snippets are similar in structure but applied to smaller sets, with finer granularity to what can be controlled (saved or restored).

When restoring Scenes, a series of flags will enable protection of existing (already in place) parameters. These flags are listed as “Scene Safes” (see below) and address rather large groups of elements.

A different set of flags enables what is actually saved with Snippets, controlling the affected areas in a much finer manner.

A complete list of elements found in Scenes and Snippet files is given in appendix of this document.

Scene 0 cannot have “Scene Safes” associated to it. Starting with FW release 4.02, X32/M32 support a special scene file that can be automatically loaded at boot time. The file must be in the root directory of the USB drive and be named CustomBootState.scn. This can be quite useful for ensuring a proper reset of the desk to a specific set of parameters at start time, rather than relying on a manual load of scene 0 or a console reset state from the config screen.

### Scene Safes: How do they work?

There’s been numerous comments and questions about “Scene Safes”; How do they work? When do they actually apply? And what to?

When a scene is saved, *\*all\** parameters that can affect the audio signal path are saved to a text file in one of the 100 Scene slots of the X32 (and can be exported to the USB stick). Scenes are a way to quickly and efficiently save the audio-related state of your desk, so you can recall your current settings, or move them to another desk. There is not much granularity in Scenes, they are composed of rather large sections, covering thousands of parameters in a 2105 lines text file (extension in “.scn”).

So, you saved a Scene and want to (re)apply it to your desk; you can overwrite all parameters or a subset of them, according to the low granularity mentioned above. This is what SAFES are for: selecting what (groups of) elements that will *\*not\** be modified when you recall a previously saved Scene. **SAFES are only applying on recall of Scenes.**

The Scene screen SAFES are 8 groups of parameters types: *Talkback*, *Effects*, *Mix Buses*, *Chan Process*, *Configuration*, *Preamp (HA)*, *Output Patch* and *Routing I/O*. The way you set these when saving a scene has no effect at all on the saving process, and does not change the scene flags in the file that is created (all flags in the file will always be %00000000).

SAFE parameters are actually a finer set than the 8 main groups mentioned above, and can be set directly at the desk, under the SCENES screen; the “param safe” and “chan safe” tabs can be used for you set or select the

parameters or channels you want to preserve from any change as a Scene gets loaded to the desk.

When you recall a Scene to update your desk, it is important to ensure the SAFE flags are set as your expectation. Any section that has a flag set will not affect/update the desk when the Scene is recalled/applied/loaded.

### Presets (/libs)

The X32/M32 family of products can accept 3 different types of presets: Channel, Effects and Routing.

Presets are files which can be loaded in one of the 3 x 100 preset memory slots of the X32/M32. They consist of X32node like commands dedicated to the domain they address.

- Channel presets contain `/node` commands used for X32/M32 channels (i.e. beginning with `[/]ch/[01...32]/...`)
- Routing presets contain `/node` commands used for X32/M32 Routing (i.e. starting with `[/]config/routing/...`)
- Effects presets contain `/node` commands used for X32/M32 Effects (i.e. beginning with `[/]fx/[1...8]/...`)

In the case of Channels and Effects, the corresponding header is not present as Channel and Effect presets are not dedicated to specific channels or effect slots.

- AES/DP48 settings

A complete list of elements found in Channel, Effects, Routing and AES/DP48 preset files is given in appendix of this document.

Shows, Scenes, Snippets and Presets can be saved to and retrieved from memory or the USB drive with appropriate controls available on the different systems. They can also be controlled with the OSC commands below.

The `/showdump` command can be a way to read from the server all information related to Cues, Scenes, and Snippets for the current Show.

The `/-show/...` commands are used to get/set elements and values related to Shows, Cues, Scenes and Snippets.

The `/-libs/...` commands are used for listing and dealing with presets.

### Manipulation of datasets (/add, /copy, /save, /load, /delete, /rename)

The `/add`, `/copy`, `/save`, `/load`, `/delete` and `/rename` commands are used to manage or update internal entities such as cues, scenes, snippets and presets within the X32/M32. A scene will save all data while a snippet will save small changes made to an existing scene. If the scene, snippet or preset already exists at the index provided in the command, the element at that given index is updated with new information. Otherwise, a new internal entity is created at the given index. These operators manage data between the X32/M32 internal storage (not the USB drive) and the X32/M32 audio engine state or preset libraries in memory.

#### Show, Cue, Scene, Snippet, and Preset Management

|                                    |      |  |  |
|------------------------------------|------|--|--|
| <code>/showdump</code>             | none | Requests the X32/M32 to send all Cue, Scene and Snippet related data.<br>Cues, Scenes and Snippets data are returned using one or more X32node messages (see below).<br>If no cues, scene, or snippets exist, only the first line is reported by the command (see below in "Notes on the use of <code>/showdump</code> " paragraph). |  |
| <code>/-show/prepos/current</code> | int  | Scene page cue, scene or snippet slot highlighted line/index is <int> value. int = [1-099]<br><b>Note:</b> selection of cue/scene/snippet depends on the   |  |

|         |                |  |  |

**Note/bug:** in FW 2.08, it seems that Scenes and Snippets numbers associated to Cues are not always listed correctly on the X32 LCD SCENES screen, under home page; they can appear listed on the first line rather than respective of their associated Cue index. Selecting/Associating Scenes and Snippets to Cues AFTER cues are created seem to avoid this issue.

**Note/bug:** in FW 2.08, specifically on X32 CORE, it seems that upon asking to load a show from a USB drive, the last snippet from the show is not loaded; it is therefore advisable to add an empty snippet at the end of the list of snippets. This does not happen on X32 standard.

**Note:** The OSC data resulting from a */node* command does not comply to OSC standard (no leading "/"); the returned string is "\n" (a.k.a 0x0a) terminated, which makes it suitable for direct printing or editing with a standard text editor.

**Note:** the preset name *libmon*, corresponding to AES/DP48 settings, only exists starting with FW 4.0. In 4.0 FW, it takes a manual screen refresh to show the result of /save, /load, /copy, /delete, and /rename commands above

## Notes on the use of /showdump

/showdump will trigger the X32/M32 server to dump all Scene and Snippet data back to the requesting client. This can generate a large amount of data back to the client, with possible overruns in UDP packets. It is important to ensure a very reliable connection is in place between the X32/M32 and the receiving device.

By experience, 54Mbps/s WIFI is not recommended for Shows with more than 20 lines (cues, scenes or snippets) as there is a high probability of UDP buffer overflow/overrun. Higher data throughput rate are recommended, or better, a 100Mbps/s wired connection.

Replies to client are formatted as per X32node commands format, as shown in the examples below.

X32/M32 does not have any scene or snippet, the answer to a /showdump request is:

```
node~~~~,s~/showfile/show "MyShow" 0 0 0 0 0 0 0 0 0 0 "2.08"
```

X32/M32 has a single scene (in scene slot 01, name: AAA, note: aaa) with Routing IO and Output Patch selected as Scene Safes, no snippet, the answer to a /showdump request is:

```
node~~~~,s~/show/showfile/show "MyShow" 0 0 0 0 0 0 0 0 0 0 "2.08"
node~~~~,s~/show/showfile/scene/001 "AAA" "aaa" %110000000 1
```

X32/M32 has a single scene (in scene slot 01, name: AAA, note: aaa) with all items selected as Scene Safes, no snippet, the answer to a /showdump request is:

```
node~~~~,s~/show/showfile/show "MyShow" 0 0 0 0 0 0 0 0 0 0 "2.08"
node~~~~,s~/show/showfile/scene/001 "AAA" "aaa" %111111110 1
```

We now add a new scene (in scene slot 02, name: BBB, note: bbb) with Talkback selected as Scene Safes, no snippet, the answer to a /showdump request is:

```
node~~~~,s~/show/showfile/show "MyShow" 0 0 0 0 0 0 0 0 0 0 "2.08"
node~~~~,s~/show/showfile/scene/001 "AAA" "aaa" %111111110 1
node~~~~,s~/show/showfile/scene/002 "BBB" "bbb" %000000010 1
```

Keeping the 2 scenes created above, we create a snippet in slot 00, with name: Aaa, selecting Parameter Filter Preamp(HA) and Channels Ch. The answer to a /showdump request is:

```
node~~~~,s~/show/showfile/show "MyShow" 0 0 0 0 0 0 0 0 0 0 "2.08"
node~~~~,s~/show/showfile/scene/001 "AAA" "aaa" %111111110 1
node~~~~,s~/show/showfile/scene/002 "BBB" "bbb" %000000010 1
node~~~~,s~/show/showfile/snippet/000 "Aaa" 1 1 0 0 1
```

Updating snippet in slot 00 with selecting Main/Matrix/Group parameter DCA 8, and saving the snippet to slot00 with no other changes, the answer to a /showdump request is:

```
node~~~~,s~/show/showfile/show "MyShow" 0 0 0 0 0 0 0 0 0 0 "2.08"
node~~~~,s~/show/showfile/scene/001 "AAA" "aaa" %111111110 1
node~~~~,s~/show/showfile/scene/002 "BBB" "bbb" %000000010 1
node~~~~,s~/show/showfile/snippet/000 "Aaa" 1 1 0 32768 1
```

Keeping all data unchanged, we create a cue, name it "CCC", at index 1, selecting scene = -1 (none) and snippet = -1 (none). The answer to a /showdump request is:

```
node~~~~,s~/show/showfile/show "MyShow" 0 0 0 0 0 0 0 0 0 0 "2.08"
node~~~~,s~/show/showfile/cue/000 100 "CCC" 0 -1 -1 0 1 0 0
node~~~~,s~/show/showfile/scene/001 "AAA" "aaa" %111111110 1
node~~~~,s~/show/showfile/scene/002 "BBB" "bbb" %000000010 1
node~~~~,s~/show/showfile/snippet/000 "Aaa" 1 1 0 32768 1
```

Keeping all data unchanged, we create a new cue, name it "Ccc", at index 1.1, selecting scene 01 and snippet = -1. The answer to a /showdump request is:

```
node~~~~,s~~/-show/showfile/show "MyShow" 0 0 0 0 0 0 0 0 0 0 "2.08"
node~~~~,s~~/-show/showfile/cue/000 100 "CCC" 0 -1 -1 0 1 0 0
node~~~~,s~~/-show/showfile/cue/001 110 "Ccc" 0 1 -1 0 1 0 0
node~~~~,s~~/-show/showfile/scene/001 "AAA" "aaa" %111111110 1
node~~~~,s~~/-show/showfile/scene/002 "BBB" "bbb" %000000010 1
node~~~~,s~~/-show/showfile/snippet/000 "Aaa" 1 1 0 32768 1
```

Selecting "skip" on cue Ccc, the answer to the X32node command appears as:

```
node~~~~,s~~/-show/showfile/cue/001 110 "Ccc" 1 1 -1 0 1 0 0
```

Updating cue CCC with snippet 0 (Aaa) selected, the X32node command answer appears as:

```
node~~~~,s~~/-show/showfile/cue/001 100 "CCC" 0 -1 0 0 1 0 0
```

Keeping all data unchanged, we create a new cue at index 2, name it "DDD", selecting scene 02 and snippet = 03. The answer to a /showdump request is:

```
node~~~~,s~~/-show/showfile/show "MyShow" 2 2 1 1 0 0 1 1 0 0 "2.08"
node~~~~,s~~/-show/showfile/cue/000 100 "CCC" 0 -1 0 0 1 0 0
node~~~~,s~~/-show/showfile/cue/001 110 "Ccc" 1 1 -1 0 1 0 0
node~~~~,s~~/-show/showfile/cue/002 200 "DDD" 0 2 3 0 1 0 0
node~~~~,s~~/-show/showfile/scene/001 "AAA" "aaa" %111111110 1
node~~~~,s~~/-show/showfile/scene/002 "BBB" "bbb" %000000010 1
node~~~~,s~~/-show/showfile/snippet/000 "Aaa" 1 1 0 32768 1
```

## X32/M32 console status commands

### Preferences (/prefs) data

| Preferences data             |        |  |  |
|------------------------------|--------|--|--|
| /prefs/style                 | string | Name given to your prefs ex: "Patrick". Will be "ablesque" after factory reset   |  |

## USB (/usb) data

This section enables accessing and setting some of the parameters of the USB stick.

**Note:** all options may not be enabled or documented.

| USB (/usb)              |        |   |  |
|-------------------------|--------|---|--|
| /usb/path               | string | Name of the current directory, e.g.:<br><i>/usb/path~~,s~~Dbles 48kHz~~~~</i>   |  |
| /usb/title              | string | Name of a file in the current directory of USB stick, e.g.:<br><i>/usb/title~,s~~Candy-DB~~~~</i>   |  |
| /usb/dir/dirpos         | int    | Current directory entry number  |  |
| /usb/dir/maxpos         | int    | Number of entries of the current directory in USB stick,<br>e.g.:<br><i>/usb/dir/maxpos~~~~,i~~&lt;int=16&gt;</i>   |  |
| /usb/dir/001...999/type | string | The type of file at position 000...999 of current directory<br>in USB stick, e.g.:<br><i>/usb/dir/006/type~~,s~~~~~</i>   |  |
| /usb/dir/001...999/name | string | The name of file at position 000...999 of current directory<br>in USB stick, e.g.:<br><i>/usb/dir/006/name~~,s~~Candy.wav~~</i><br><i>The file "candy.wav" is at position 6 in</i><br><i>the current directory</i><br><br>Can also return the name of a directory in the usb stick,<br>e.g.:<br><i>/usb/dir/001/name~~,s~~[...]~~~~</i><br><i>/usb/dir/002/name~~,s~~[Dbles 44.1Khz]~~</i><br><i>/usb/dir/003/name~~,s~~[Dbles 48kHz]~~</i> |  |

## Status (/stat) data

Status data (screen, tape, fader groups, solo, etc.)

|                            |      |   |  |
|----------------------------|------|---|--|
| /stat/selidx <sup>46</sup> | enum | {Ch01...Ch32, Aux1...Aux8, Fx1L...FX4R, Bus1...Mtx1...Mtx6, LR, M/C}, int with value [0..71],<br>Select channel index<br>0-31: Ch 1-32<br>32-39: Aux in 1-8<br>40-47: FxRtn 1-8<br>48-63: Bus master<br>64-69: Matrix 1-6<br>70: L/R<br>71: Mono/Center |  |
| /stat/chfaderbank          | int  | Select Main channel fader bank:<br>0: CH 1-16<br>1: CH 17-32<br>2: Aux in / USB / FX returns<br>3: Bus masters  |  |
| /stat/grpfaderbank         | int  | Select Group channel fader bank:<br>0: DCA 1-8<br>1: BUS 1-8<br>2: BUS 9-16<br>3: Matrix 1-6, Main C<br>4: TBD<br>5: Channels 1-16 on X32/M32 compact or producer <sup>47</sup>   |  |
| /stat/sendsonfader         | enum | {OFF, ON}, int with value 0 or 1, state of Sends on Faders  |  |
| /stat/bussendbank          | int  | Select Bus Sends bank:<br>0: Rotary buttons map to Bus 1-4<br>1: Rotary buttons map to Bus 5-8<br>2: Rotary buttons map to Bus 9-12<br>3: Rotary buttons map to Bus 13-16   |  |
| /stat/eqband               | int  | Select EQ band (in the HOME->EQ screens)<br>0: Low<br>1: Low2<br>2: Lo-Mid<br>3: Hi-Mid<br>4: High2<br>5: High<br>Low2 and High2 are only available with 6 band equalizers, such as used in Bus, Matrix, M, and L/R strips.                             |  |
| /stat/solo                 | enum | {OFF, ON}, int with value 0 or 1 (read only), state of CLEAR SOLO button<br>0: No SOLO selected<br>1: At least one SOLO selected  |  |
| /stat/keysolo              | enum | {OFF, ON}   |  |
| /stat/userbank             | int  | Display User ASIGN bank settings on X32/M32 (pressing on SET A/B/C buttons):<br>0: User bank A<br>1: User bank B  |  |

<sup>46</sup> /stat/selidx will be generated by X32 for all channels except L/R when the /-prefs/autosel function is ON. DCA faders will also not be monitored by the /-prefs/autosel function.

<sup>47</sup> In order to ensure 16 channels can spread over the left and right banks of X32/M32 Compact or Producer, the chfaderbank parameter should be set to 0 [chi 01-16].

|                           |      |   |  |

## Action (/action) data & Undo (/undo)

| Action data       |        |   |  |
|-------------------|--------|---|--|
| /action/setip     | int    | 0 by default; changing to 1 resets Network parameters.<br><i>Use with Caution!</i>  |  |
| /action/setclock  | string | Set clock value   |  |
| /action/initall   | int    | Initialize X32 Console, 0 by default<br>0: No-op<br>1: Init console   |  |
| /action/initlib   | int    | Initialize X32 Libraries, 0 by default<br>0: No-op<br>1: Init libraries   |  |
| /action/initshow  | int    | Initialize X32 Show data, 0 by default<br>0: No-op<br>1: Init show data   |  |
| /action/savestate | int    | Save X32/M32 state<br>0: No-op<br>1: Save state (before power off)  |  |
|                   |        |   |  |
| /action/undopt    | int    | Creates checkpoint to get back to upon issuing an undo command. The time of the undo point will then be set in /undo/time, replacing any value already there  |  |
| /action/doundo    | int    | 0: No-op<br>1: Undo<br>Performs an undo (see /action/undopt and /undo/time) if parameter is 1   |  |
|                   |        |   |  |
| /action/playtrack | int    | Plays track from USB recorder, 0 by default<br>-1: Previous track<br>0: Not playing<br>1: Next track  |  |
| /action/newscreen | int    | Renew LCD screen display<br>0: No<br>>0: Yes  |  |
| /action/clearsolo | int    | Clear all solo buttons<br>0: No-op<br>1: Clear solo (as if pressing the CLEAR SOLO button)  |  |
| /action/setprebus | int    | 0   |  |
| /action/setstrate | int    | Select sampling rate:<br>0: 48kHz<br>1: 44.1KHz   |  |
| /action/setrtasrc | int    | Selects the source used for RTA display:<br><int> represents the channel #<br>0-31: Ch 1-32<br>32-63: Ch 33-64<br>64-47: Aux in /USB<br>48-63: Bus master<br>64-69: Matrix 1-6<br>70: L/R<br>71: Mono/Center<br>72: Monitor |  |
| /action/recselect | int    | Select and execute record <int> in the current directory. Records are numbered 1...n  |  |
|                   |        |   |  |
| /action/gocue     | int    | Loading a saved cue;  |  |

|                      |     |   |    |
|----------------------|-----|---|----|
|                      |     | the Cue number to load is given as an int parameter ranging from 0 to 99  |    |
| /-action/goscene     | int | Loading a saved scene;<br>the Scene number to load is given as an int parameter ranging from 0 to 99  |    |
| /-action/gosnippet   | int | Loading a saved snippet;<br>the Snippet number to load is given as an int parameter ranging from 0 to 99  |    |
|                      |     |   |    |
| /-action/selsession  | int | Select X-Live! sdcard record session index [1...100]<br>When a valid session is selected, the card provides various information about the session, and lists the markers for that session. Below is an example of selecting session #6, which contains 3 markers:<br><pre> /-action/selsession ,i 6 -&gt;X, 28 B: /-action/selsession~,i~~[ 6] X-&gt;, 28 B: /-action/selsession~,i~~[ 0] X-&gt;, 28 B: /-stat/urec/rtime~~~,i~~[ 4970] X-&gt;, 28 B: /-urec/sessionlen~~~,i~~[ 4970] X-&gt;, 24 B: /-urec/srate~~~~~,i~~[ 0] X-&gt;, 28 B: /-urec/sessionpos~~~,i~~[ 6] ... X-&gt;, 32 B: /-urec/marker/001/time~~,i~~[ 1] X-&gt;, 32 B: /-urec/marker/002/time~~,i~~[ 99] X-&gt;, 32 B: /-urec/marker/003/time~~,i~~[ 199] X-&gt;, 28 B: /-urec/markermax~~~~~,i~~[ 3] </pre> |    |
| /-action/delsession  | int | Delete X-Live! sdcard record session index [1...100]. This command is replied with a [0], indicating the command has been processed   |    |
| /-action/selmarker   | int | Select X-Live! marker index [1...100]. This command is replied with a [0], indicating the command has been processed  |    |
| /-action/delmarker   | int | Delete X-Live! marker index [1...100]. This command is replied with a [0], indicating the command has been processed  |    |
| /-action/savemarker  | int | Save X-Live! sdcard position at marker index [1...100]. This command is replied with a [0], indicating the command has been processed   |    |
| /-action/addmarker   | int | Add X-Live! Marker [0,1]  |    |
| /-action/setposition | int | Set X-Live! sdcard position, in milliseconds. The position is a 32bit value [0...86399999], corresponding to 24h of recording.  | ms |
| /-action/clearalert  | int | Clear X-Live! alert status [0,1]<br>0: No-op<br>1: Clear alert  |    |
| /-action/formatcard  | int | Format active sdcard <sup>49</sup><br>Upon formatting, the following messages will be returned with sd1 or sd2 depending on the selected card:<br><pre> X-&gt;, 28 B: /-action/formatcard~,i~~[ 0] X-&gt;, 24 B: /-urec/sd1state~,i~~[ 3] X-&gt;, 44 B: /-urec/sd1info~~,s~~Formatting SD Card..~~~~ X-&gt;, 24 B: /-urec/sd1state~,i~~[ 1] X-&gt;, 40 B: /-urec/sd1info~~,s~~4 GB - 44m, 1s ~~~~~ </pre>   |    |

<sup>49</sup> See the /prefs/card/URECsdsel command

|  |        |   |  |
|--|--------|---|--|
|  |        | The last two messages will be returned after the formatting of the SDCard is completed. The content of the <code>/-urec/sd1info</code> message obviously depends on the SDCard.   |  |
|  |        |   |  |
| <code>/-undo/time</code><br><br><b>Note:</b> There's only 1 undo step in X32 | string | Displays the most recent time value recorded for changes, for example in selecting a scene. Time is coded as string, e.g. <code>18:36:54</code><br>Setting of the value is dependent on console changes or set by the <code>/-undo/time</code> command<br><br><i>If string is empty: there are no more undo steps available</i> |  |

### X-Live! sdcard recording (/urec)

These commands are read-only and report the status of the X-Live! (optional) extension card or its components' state.

| X-Live data        |        |  |    |
|--------------------|--------|--|----|
| /urec/sessionmax   | int    | X-Live! record session max index [0...100]<br>A value of 0 means there are no sessions in the sdcard (such as after formatting for example)                                    |    |
| /urec/markermx     | int    | X-Live! marker max index [0...100]<br>A value of 0 means there are no markers in the session   |    |
| /urec/sessionlen   | int    | X-Live! record session length in milliseconds; a 32bit value [0...86399999], corresponding to 24h max of recording.  | ms |
| /urec/sessionpos   | int    | X-Live! record session current index [0...100]<br>A value of 0 means there is no session selected  |    |
| /urec/markerspos   | int    | X-Live! marker current index [0...100]<br>A value of 0 means there is no marker selected   |    |
| /urec/batterystate | enum   | {NONE, GOOD, LOW}, int with value [0..2]<br>X-Live! internal battery state<br>0: NONE<br>1: GOOD<br>2: LOW   |    |
| /urec/srate        | int    | X-Live! record session sampling rate:<br>0: 44.1kHz<br>1: 48kHz  |    |
| /urec/tracks       | int    | X-Live! recording type:<br>0: None<br>8: 8 tracks<br>16: 16 tracks<br>32: 32 tracks  |    |
| /urec/sessionspan  | int    | Indicates if recording spans from one sdcard to the next [0...3]<br>0: No spanning<br>1: Span 1 of 2<br>2: Span 2 of 2<br>3: Jump to 2/2                                       |    |
| /urec/sessionoffs  | int    | Denotes the end point of the first part of an X-Live! spanned session in milliseconds; a 32bit value [0...86399999]  |    |
| /urec/sd1state     | enum   | {NONE, READY, PROTECT, ERROR}, int with value [0..3]<br>X-Live! sdcard 1 state<br>0: NONE<br>1: READY (ready for use)<br>2: PROTECT (protected card)<br>3: ERROR (error state) |    |
| /urec/sd2state     | enum   | {NONE, READY, PROTECT, ERROR}, int with value [0..3]<br>X-Live! sdcard 2 state<br>0: NONE<br>1: READY (ready for use)<br>2: PROTECT (protected card)<br>3: ERROR (error state) |    |
| /urec/sd1info      | string | 32 chars string giving information for sdcard 1; for   |    |

|  |                                  | <b>example:</b> <code>/-urec/sdlinfo</code><br><code>-&gt;X, 16 B: /-urec/sdlinfo~~</code><br><code>X-&gt;, 40 B: /-urec/sdlinfo~~,s~~4 GB - 43m, 54s ~~~~</code>  |                     |            |       |  |                 |                 |                |  |                |  |                    |                                 |                 |  |              |  |              |                              |                |  |                |  |                   |                                 |                 |                                 |                   |                                  |                     |                                 |                    |  |                    |                        |                 |  |                  |  |                   |                                |                  |                                  |                 |  |                  |              |                 |  |                    |  |  |

## X-Live! recording data

| Range Maximum values |       |         |         |              |
|----------------------|-------|---------|---------|--------------|
| 32-bit address range | hours | minutes | seconds | milliseconds |
| 4.294.967.296        | 24    | 1440    | 86,400  | 86,399,999   |

| Locator Resolution |        |        |       |             |
|--------------------|--------|--------|-------|-------------|
| Channels           | 8-ch   | 16-ch  | 32-ch | Sample rate |
| 32kB cluster       | 4.00k  | 2.00k  | 1.00k |             |
| 8kS @44k1          | 23.2ms | 11.6ms | 5.8ms | @44.1kHz    |
| 8kS @48k           | 21.3ms | 10.7ms | 5.3ms | @48kHz      |

## Recording data format

X-Live! SD-card interface is optimized for write speed ensuring long 32 channel recordings of 48 kHz / 32-bit PCM data, with minimal risk for audio drop-outs on a large variety of SD or SDHC cards. Class-10 cards (guaranteed 10MB/s write speed) are recommended for use with X-Live!

In order to achieve optimum write performance, all tracks (8, 16 or 32) are written into the same file. The file format is 32-bit PCM multi-channel WAV. Supported card file system is FAT32 (royalty free). The individual file size with 32-bit formatting is 4GB.

Recording 32 tracks of 48 kHz uncompressed 32-bit audio requires about 340 MB of memory per minute. Hence, a 4GB file may not be longer than 11.7 minutes at maximum audio bitrate. In order to allow for longer consistent recording time, X-Live! creates a so-called Session, i.e. a folder containing one or more files (or *takes*) of up to 4GB each.

Separating recorded sessions into individual wave files, or creating multi-channel sessions from individual files for playback on X-Live! require the use of external utilities<sup>51</sup> or can be managed directly from DAW software (for separating sessions into individual files).

## Recording Session

The X-Live! card will auto-create a subfolder underneath "X-LIVE", named by the 32-bit timestamp of the recording start as an 8-character hex-string, e.g. "4ACE72B1". The Console will read the folder name and display the corresponding timestamp as the session name, unless it was given another name (see below).

The Session name coding is done on 32 bits and displays as a string of 8 hexadecimal characters. The format is as such:

|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |   |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|
| Y  | Y  | Y  | Y  | Y  | Y  | Y  | Y  | M  | M  | M  | M  | D  | D  | D  | D  | D  | H  | H  | H  | H  | H  | M  | M  | M  | M  | M  | M  | S  | S  | S  | S  | S |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 09 | 08 | 07 | 06 | 05 | 04 | 03 | 02 | 01 | 00 |   |

Years are counted starting at 1980

Seconds are divided by 2

<sup>51</sup> X32Xlive\_Wav and X32Wav\_Xlive (<https://sites.google.com/site/patrickmaillot/x32>) provide both ways conversions. XLive SD Splitter (<https://sites.google.com/view/x32-stuff-here/home>), or Wave Agent (<https://www.sounddevices.com/>) provide splitting capability.

Session folders include a binary session log file "SE\_LOG.bin", and 1 or more takes as multichannel wave files, up to 4GB each. The name of these takes is 8-characters long and in the range of "00000001.wav" to "00000128.wav" exactly.

The maximum recording time is 24h, no matter if 8, 16 or 32 channels are recorded. When spanning a recording from one SD-card to the other, the session's folder name on the other card will be the same as on the first card, and the takes inside will start being numbered from 00000001.wav upwards again.

### **Preproduced Session (for playback)**

The SD card will require a subfolder "X-LIVE" in the root directory, which is to contain the Session folder that may be named with up to 19 ASCII characters<sup>52</sup>. The Session folder needs to contain multichannel WAV files, up to 4GB each, all 32-bit PCM takes which names must be 8-characters long and in the range of "00000001.wav" to "00000128.wav" exactly.

For a consistent WAV header structure, all of these files should be created using the same DAW/editor tool, at the same 44.1 or 48 kHz sample rate and with the same channel count, i.e. 8, 16 or 32 channels

If not provided, the Console will create a session log file automatically, read the optional user-given 19-character folder name and copy it into the log file, before renaming the folder with the creation time stamp. When possible, the Console displays the session name, rather than the timestamp. Markers will be read if available and the binary session log file "SE\_LOG.bin" will be updated with any Markers applied during playback.

### **Drop Outs**

Drop outs are caused by record/playback buffer under-runs due to insufficient SD card data transfer performance. X-Live! provides a 10s audio buffer for recording, however, there are old/cheap/slow cards that cannot meet the required average data rate, or present available free memory that is so fragmented that allocating/finding suitable space for write operations takes too much time. If possible, formatting the card before use is always a good idea.

### **Fragmentation**

When a freshly formatted card is used for recording, then all data will be written in consistent address ranges successively, and there is no fragmentation. File fragmentation happens when previous cut/delete operations were performed. The deleted file areas will be recognized as "free memory" in the file system, and when a recording (write pointer) reaches the end of the SD memory, it is redirected to the next free space, i.e. a formerly deleted area. Finding the next free memory area might take too long, especially when using extremely large SD memory (i.e. several hundred of GB).

<sup>52</sup> This seems incorrect; only 16 or 17 characters can be displayed and it seems this is the real/actual limit.

## Subscribing to X32/M32 Updates

There may be situations when you (or the application you write) may not want to receive all data sent by the X32/M32 resulting of maintaining a `/xremote` command active, as this may represent a lot of data to parse.

Besides the `/xremote` command which enables clients to receive pretty much all X32/M32 changes or updates resulting from an <OSC Address Pattern> Set parameter command sent from a different client, there are a series of commands a client can use to manage specific updates from X32/M32: `/subscribe`, `/formatsubscribe`, `/batchsubscribe`, `/renew`, and `/unsubscribe`

If not renewed within 10 seconds, the `/subscribe`, `/formatsubscribe`, `/batchsubscribe` commands names and attributes are forgotten and lost. Indeed, an attempt to renew one of the above commands received past the 10s delay will have no effect.

The `/subscribe` command enables getting regular updates for a single <OSC Address Pattern> command. A typical use would be: `/subscribe ,si <command> [tf]`, where

`<command>` is an X32/M32 <OSC Address Pattern> parameter command, for example: `/ch/01/mix/on`

`[tf]` is an integer which sets the number of updates received over a 10 seconds period:

`[tf]: 0` → 200 updates

`2` → 100 updates

`[...]`

`40` → 5 updates

`80 to 99` → 3 updates, values outside of the range `[0...99]` are considered 0

The `/formatsubscribe ,ss[s...]iii <name> <command> [<command>...] [i0][i1][tf]` goes one step further and enables receiving regular updates for a series of commands, optionnaly using wildcard `'*` characters to represent variable ranges.

`<name>` is an alias (string) given to the command, and can be later used for requesting specific renews for additional rounds of updates. As the alias will be used as an OSC address pattern, it is a good idea to start the alias name with a leading `'/'`.

`<command>` is an <OSC Address Pattern> command. There can be several commands in a single `/formatsubscribe`. Some X32/M32 commands refer to range attributes, such as in a channel number: `[01-32]`. Range data character digits can be replaced by `'*` characters. For example `/dca/[1-8]/on` is replaced by `/dca/*/on`, `/ch/[01-32]/mix/on` will be replaced by `/ch/**/mix/on`, and so on.

`[i0]` and `[i1]` are integers to represent the start and end range numbers, respectively.

`[tf]` as previously, is an integer affecting the number of updates received over a 10 seconds' period.

(Each response from X32 above is spaced by about 3 seconds)

The previous example asks for receiving during the next 10s about 3 updates of the states of mutes for channel 06 to channel 09 inclusive. The command is aliased “/testme” and can be renewed using a /renew ,s /testme command sent within the 10s following the call to /formatsubscribe. The 4 values of channel mutes are returned as an OSC blob, as shown above with the hex dump, the responses are made of the name<sup>53</sup> of the command: /testme, a blob tag ,b followed by a 32bit big endian integer with value 20 representing the number of chars in the OSC blob payload. The blob itself consists of 32bit little endian integers; the first int is the blob length in bytes (20 again), from which the total number of ints of the blob can be computed (20/4 = 5), meaning there are 4 ints following the first one. If the channel [06-09] mute states were to change during the effective time of the command, the values of the respective ints (all ‘1’ here) would have been changed to ‘0’.

The next example below starts with Bus 01 & 02 linked, and Channels 09 to 13 being muted. With /xremote being maintained active, a /formatsubscribe command is issued, requesting 10 updates for buslink/1-2, and channel [10-12] mutes updates. As the command executes, Bus/1-2 is unlinked, then channels 09 to 13 are successively unmuted. The command does repeatedly report mute status only for channels 10 to 12, as requested.

For easier reading, the X32 data resulting of user action reported thanks to the /xremote command being active is displayed in red, while the data resulting from the /formatsubscribe command is displayed in blue.

(Each response in blue from X32 above is spaced by about 1 second)

<sup>53</sup> It is not mandatory but very wise to use a leading ‘/’ character for the <name> parameter; indeed, the data sent back by the X32 will use <name> as OSC address pattern for the command and most OSC libraries will need this to be OSC protocol compliant, so it must begin with a ‘/’.

*/batchsubscribe* is a command to display meter data only [TBV]. The format is close to */formatsubscribe*: The command is aliased to a name and accepts a single meter command followed by two ints for the meter command parameters (ints are 0 if the meter command does not take arguments); as for the other commands, the last int represents a time factor.

```

Refer to the */meter/5 meters* command for the meaning of the two arguments [3] and [1].

As already mentioned, the above subscription commands are valid for 10s. In order to keep receiving data from the X32/M32, subscriptions have to be renewed with the */renew* command. The command takes one optional argument, a string type to specify the subscription to renew. This will be either the name of the actual command or the name of the command alias for renewing */formatsubscribe* and */batchsubscribe* commands. It is possible to renew all active subscriptions by not providing any name to the */renew* command.

Managing multiple subscriptions

As shown above, the X32/M32 can manage multiple subscriptions. Data from different subscriptions will be mixed. Shown below, 3 different subscription requests are made for a period of 10s. Commands are in black and the X32 replies are in 3 different colors for easier reading.

At anytime, subscriptions can be stopped using the `/unsubscribe` command. As several subscriptions can be active at one time, the command takes a string argument to select which subscription should be stopped. An `/unsubscribe` command with no argument will stop all active subscriptions.

### Subscribing to data updates

| Subscribe to data             |  |   |  |
|-------------------------------|--|---|--|
| <code>/subscribe</code>       | string<br>int  | String: an X32/M32 command, int is a time_factor  |  |
| <code>/formatsubscribe</code> | string<br>string<br>[string...]<br>int<br>int<br>int | The first string is the alias name for the command; the sccond string is one or more commands with possible wildcards. The two first ints represent the wildcards range, and the last int is the time_factor  |  |
| <code>/batchsubscribe</code>  | string<br>string<br>int<br>int<br>int                | The first string is the alias name for the meter command; the sccond string the meter commands. The two first ints can be used for the meter command arguments if needed, and the last int is the time_factor |  |
| <code>/renew</code>           | [string]   | Element to be renewed (can be an alias of a command).<br>Absence of parameter means renew "all" active subscriptions  |  |
| <code>/unsubscribe</code>     | [string]   | Subscription to be stopped (can be an alias of a command).<br>Absence of parameter means: stop "all" active subscriptions   |  |

**Note:** Strings, when returned in subscribe commands blobs are 32byte fixed length, padded with `\0` if necessary.

## X32node (/node, / ) commands

X32/M32 nodes are collections of parameters grouped in logical sets. They enable sending or receiving complex commands by grouping several parameters, optimizing the communication between X32/M32 and its clients (less I/O operations and less data to transmit). For some of them they also serve as the base to scene and snippet files through the use of `/node` or `/` commands, explained below.

The `/` command is used to send X32node formatted commands (i.e. similar formatting as of a `/node` command) to the X32/M32, thus updating several or all parameters of a node at once and using clear text data. The command follows the standard OSC specification and takes a single string as argument. The data to send should conform to X32/M32 formats and known values, but the X32 will keep the closest value to the one sent if that is not the case; for example, sending `/ ,s "ch/01/mix/fader -85.4"` will be kept as `-85.3`, as `-85.4` is not one of the 1024 “known values” for faders<sup>54</sup>.

The leading `‘/’` of the command to be sent to X32 is not mandatory, i.e. sending `/ ,s "/ch/01/mix/fader -85.4"` is the same as sending `/ ,s "ch/01/mix/fader -85.4"`.

Data sent with `/` commands is in the form of a variable list of arguments; i.e. the list of data does not have to be complete for the command to be valid and accepted. Of course, parameters have to be provided in the order they are expected to by X32, and only those which are sent will provide updated values, for example:

```
/~~~,s~~ch/01 name 30
```

Will only set the two first items of the `/ch/01/config` node which is composed of name, icon, color and source. A complete for of the command would for example be:

```
/~~~,s~~ch/01 newname 10 CY 1
```

The X32/M32 will echo back the `"/"` commands it receives, enabling a better control of the flow of data and helping avoid overruns by ensuring an application does read the UDP buffer before sending the next command.

The `/node` command can be used by clients to request values and data for the X32node provided with the request. The server returns the full set of data associated to the request in a single string of text, ending with a linefeed.

| X32node commands   |        |   |
|--------------------|--------|---|
| <code>/</code>     | string | <p>Send X32node data passed as a string argument to X32/M32.</p> <p>Example:</p> <pre>/~~~,s~~-prefs/iQ/01 none Linear 0~~</pre> <p>or</p> <pre>/~~~,s~~/-prefs/iQ/01 none Linear 0~</pre> <p>Will set the Turbosound iQ speaker parameters at address 01 with the settings listed with the command.</p> <p>The <code>/</code> command works for all X32nodes. X32node commands sent this way will be echoed back by the X32/M32.</p> |
| <code>/node</code> | string | <p>Request the X32/M32 to return the data associated with the X32node given in argument.</p>  |

<sup>54</sup> See Appendix on fader float values

**Note/bug:** the response from the Server is “node...” and not “/node...” as one could expect. This is not OSC compliant.

## EFFECTS

### Effects Parameters

This section describes the parameters' list, order, name, type and value range for the different effects available with the X32/M32. The parameters described here correspond to the up to 64 parameters that can follow a `/fx/[1...8]/par/[01...64]` message.

Parameters can be sent one by one or combined in lists -alternating types as needed-, which is generally more efficient.

### Hall Reverb

| Effect Name           | Parameters   | Parameter Name | Type & Range     | Par # |
|-----------------------|--------------|----------------|------------------|-------|
| HALL<br>(hall reverb) | ffffffffffff | Pre Delay      | linf [0...200]   | 1     |
|                       |              | Decay          | logf [0.2...5]   | 2     |
|                       |              | Size           | linf [2...100]   | 3     |
|                       |              | Damping        | logf [1k...20k]  | 4     |
|                       |              | Diffuse        | linf [1...30]    | 5     |
|                       |              | Level          | linf [-12...+12] | 6     |
|                       |              | Lo Cut         | logf [10...500]  | 7     |
|                       |              | Hi Cut         | logf [200...20k] | 8     |
|                       |              | Bass Multi     | logf [0.5...2]   | 9     |
|                       |              | Spread         | linf [0...50]    | 10    |
|                       |              | Shape          | linf [0...250]   | 11    |
|                       |              | Mod Speed      | linf [0...100]   | 12    |

## Plate Reverb

| Effect Name            | Parameters   | Parameter Name | Type & Range     | Par # |
|------------------------|--------------|----------------|------------------|-------|
| PLAT<br>(plate reverb) | ffffffffffff | Pre Delay      | linf [0...200]   | 1     |
|                        |              | Decay          | logf [0.2...10]  | 2     |

|                        |            | Gain B         | linf [-24...+24]   | 6     |

## User ASSIGN Section

### User Definable Controls

This chapter describes the different settings and options linked to User Definable Controls, a.k.a. OSC command `/config/userctrl`, as presented in the **Configuration (/config) data** chapter.

The User Control section consists of 4 columns composed of a rotary encoder and two buttons. Encoders are numbered 1 to 4 and buttons are numbered 5 to 12.

#### Notes:

While the X32 Rack processing is fully compatible with the other variants of X32 or M32 series, it is the only product in the X32 family that does not feature any ASSIGN section controls. As a result, MIDI or other commands cannot be remotely triggered from the Rack. MIDI or other functions may be set up or edited, i.e. for creating scenes that shall be used on the larger variants where physical ASSIGN controls are available, but they cannot be used on the X32 Rack directly.

X32 Compact (Producer/Xrack) have different user assignable buttons numbering scheme. Button numbers go from 5 to 12 for X32 Standard, and 3 banks are available. X32 Compact Buttons 1 to 8 map to OSC numbers 5 to 12 of the X32 Standard.

A series of 3 buttons at the bottom of the section enables selecting one of 3 layers of user controls layers [A, B and C]. When addressing user controls to get or set data, the layer name and encoder or button number must be provided. A small LCD displays the functions the rotary encoders or buttons are assigned to.

#### Notes:

There are no OSC commands to update the 4 scribbles of the assign section. This and the lack of full user assignable data limit what can be achieved with the assign section.

There are no OSC commands to set an OSC only mode for the assign section in the current implementation.

There are no “NC” (normally closed) push-type buttons in the current implementation. “NC” push buttons types can still be implemented but do require a feedback from the receiving program to simulate a normally closed push button.

In the event a given button is assigned with a equal settings on more than one set (A, B, or C), a single action on a button will generate several OSC commands; for example if one assigns all 3 sets for button 5 with “Mn05001” (MIDI toggle, sending note 001 on MIDI channel 5, see in the following pages), pressing button 5 in one of the 3 sets will result in sending a single MIDI note (note 1, channel 5), but 3 OSC commands issued from the X32 to listening clients.

## Rotary Encoders (X32/M32 Standard)<sup>55</sup>

The data used to set encoder values is a string made of up to 7 characters. The first character (encoder assignment) selects the main functionality the encoder controls.

| Target Type            | Associated function  |
|------------------------|--|
| "_"                    | Not assigned   |

# Appendices

## Appendix – X32 Standard: Surface Controls

### Config/Preamp/Gate/Dynamics

### Equalizer

## USB/Bus Sends/Main Bus

## Monitor/Talkback

Scenes/Assign/Mute Groups

## Fader Strips

## Appendix – Converting X32 fader data to decibels and vice-versa

As mentioned earlier in this document, X32 faders implement a 4 linear functions approach with cross points at -10, -30, -60 dB to emulate the log function one can expect to manipulate volume data. Fader controls typically follow a  $\log_{10}$  function to match the human perception of loudness.

The volume ratio generic formula:  $dB\ value = 20 * \log(v2/v1)$  produces a response curve in blue, as below. On the other hand, X32 faders are using 4 different linear functions with increasing slopes to approximate the dB log transfer shape; the figure below shows the 4 different X32 line segments in red.

In both representations, 0db maps to 0.75 and 10dB maps to 1.0

The paragraphs below show a C-like conversion to go from [0.0, 1.0] to dB [-90, +10] with value 0 matching  $-\infty$ , and vice-versa. This can be useful to map with other programs or tools used, or for programmers who need to match the float values returned by OSC functions to dB values in their programs.

```
// float to dB
// "f" represents OSC float data. f: [0.0, 1.0]
// "d" represents the dB float data. d: [-∞, +10]
if (f >= 0.5)      d = f * 40. - 30.;           // max dB value: +10.
else if (f >= 0.25) d = f * 80. - 50.;
else if (f >= 0.0625) d = f * 160. - 70.;
else if (f >= 0.0)  d = f * 480. - 90.;        // min dB value: -90 or -∞61.

// dB to float
// "d" represents the dB float data. d: [-90, +10]
// "f" represents OSC float data. f: [0.0, 1.0]
if (d < -60.)      f = (d + 90.) / 480.;
else if (d < -30.)  f = (d + 70.) / 160.;
else if (d < -10.)  f = (d + 50.) / 80.;
else if (d <= 10.)  f = (d + 30.) / 40.;
// Optionally round "f" to a X32 known value
f = int(f * 1023.5) / 1023.0;62
```

<sup>61</sup> A member wrote the X32/M32 have an internal  $-\infty$  value of -144dB, but this doesn't appear in any data reported by X32.

<sup>62</sup> Thanks to F. Homman for correcting the rounding function initially proposed.

## Appendix – Scene data elements

The following table lists the control elements that can be found in a scene file. A scene file "*name.scn*" is typically 2104 lines of editable data representing the working state of the X32/M32 and controlling almost all X32/M32 parameters.

Starting with FW release 4.02, X32/M32 support a special scene file that can be automatically loaded at boot time. The file must be in the root directory of the USB drive and be named CustomBootState.scn. This can be quite useful for ensuring a proper reset of the desk to a specific set of parameters at start time, rather than relying on a manual load of scene 0 or a console reset state from the config screen.

A scene file starts with a line such as:

```
#2.7# "Scene name" "Scene note" %000000000 1
```

This first line contains the *name* and *note* associated to the scene and ends with the list of scene safes in the form of 8 [0/1] characters terminated by a 0: %000000000 and is terminated by a 1. It is then followed by (/node like commands, or X32nodes) lines from the table above; they are followed by the parameters they control; A line beginning with '#' is treated as a comment line.

**For example,** `ch/[01...32]/config` will be followed by 4 parameters, as in

```
/ch/01/config "Kick Drum" 3 YE 1
```

These parameters respectively correspond to the name given to the channel (as displayed on the Channel scribble), the icon associated with the channel scribble, the channel scribble color, and the channel source. These are detailed in their order of appearance after the corresponding `/node` commands, in this document and for the present case under the **Channel (/ch) data** chapter.

## Appendix – Snippet data elements

The table below lists the control elements that can be found in a snippet file. A snippet file "*name.snippet*" is variable in size and made of text editable data representing a subset of X32/M32 parameters.

A snippet file starts with a line such as:

```
#2.7# "Snippet name" 31473663 1 66305 449 1
```

The 4 numerical parameters following the snippet *name* and followed by '1' are the *eventtyp*, *channels*, *auxbuses*, and *maingrps* filters respectively, saved/present in the file.

This first line is then followed by the lines (/node like commands) in the table below; they are followed by the parameters they control; a line beginning with '#' is treated as a comment line.

|---|---|---|

## Appendix – Channel, Effects, Routing, and AES/DP48 preset files data elements

The table below lists the control elements that can be found in a Channel, Library, Routing, or AES/DP48 preset file. Preset files are variable in size and consist of subset of X32/M32 parameters in the form of editable text (*/node* like commands).

A preset file starts with a line such as:

```
#4.0# <pos> "Preset name" <type> %<flags> 1
```

Where

- <pos>: preset index value (can be chosen by the user)
- <type>: a type number:
  - Effects: used for sorting by type or by name and enable loading in FX slots [1...4] or [5...8]
  - Channels and Routing: unused
- <flags>: a list of 16 digits [0 or 1] representing:
  - Channels: if a channel section is present in the preset [*digits* 0...7] and whether it is active or not [*digits* 8...15] (see */-libs/ch[001-100]/flags* for details)
  - Effects and Routing: unused

This first line is then followed by the lines (*/node* like commands) in the table below; they are followed by the parameters they control; a line beginning with '#' is treated as a comment line.

| Channel*                    | Effects*       | Routing                              | AES/DP48                    |
|-----------------------------|----------------|--------------------------------------|-----------------------------|
| <i>/config</i>              | <i>/type</i>   | <i>/config/routing/routswitch</i>    | <i>/config/dp48</i>         |
| <i>/delay</i>               | <i>/source</i> | <i>/config/routing/IN</i>            | <i>/config/dp48/assign</i>  |
| <i>/preamp</i>              | <i>/par</i>    | <i>/config/routing/AES50A</i>        | <i>/config/dp48/grpname</i> |
| <i>/gate</i>                |                | <i>/config/routing/AES50B</i>        |                             |
| <i>/gate/filter</i>         |                | <i>/config/routing/CARD</i>          |                             |
| <i>/dyn</i>                 |                | <i>/config/routing/OUT</i>           |                             |
| <i>/dyn/filter</i>          |                | <i>/config/routing/PLAY</i>          |                             |
| <i>/eq</i>                  |                | <i>/outputs/main/[01...16]</i>       |                             |
| <i>/eq/[1...6]</i>          |                | <i>/outputs/main/[01...16]/delay</i> |                             |
| <i>/mix</i>                 |                | <i>/outputs/aux/[01...06]</i>        |                             |
| <i>/mix/[01...16]</i>       |                | <i>/outputs/p16/[01...16]</i>        |                             |
| <i>/headamp/[000...127]</i> |                | <i>/outputs/p16/[01...16]/iQ</i>     |                             |
|                             |                | <i>/outputs/aes/[01...02]</i>        |                             |

\* In the case of Channel and Effect types, the typical */node* header (i.e. */ch/nn/* or */fx/n/*) is not present as the file does not apply to a specific channel or effect number.

## Appendix – X32/M32 Custom Boot and Lock Screens

Firmware versions before 4.01 only propose a customizable boot screen which name must be **logo.bmp**. Custom lock screen image is not supported.

Starting with Firmware version 4.01, the X32/M32 family of products accepts customizable boot and lock screens; The boot or lock screens are images and have to be on the root of the USB drive, where the software looks for them. If the images don't fill the listed criteria, the default boot/lock screens will be shown. Images smaller than the max screen size will be centered on the screen.

Nothing is copied in the internal memory; the USB drive must be plugged in for image to be loaded. The boot and lock images must be named **CustomBoot.bmp** and **CustomLock.bmp**, respectively. They must be placed root of the USB drive.

The files must fit the following format specifications:

- Bitmap only (.bmp) in 8bit indexed mode
- Minimum size: 10 x 10 px; Maximum size: 799 x 399 px
- Colour palette embedded; Do not change the color order and use dithering for smoother pictures
- Background color will be 1<sup>st</sup> color in the palette, default text color the 2<sup>nd</sup> color
- Boot text color will be 2nd color of the palette

You can download the bitmap file above showing the X32 color palette at:

<https://drive.google.com/file/d/1BrKN4UxHpjIiX39uLLsooQN0znsv-/view?usp=sharing>

You can download the X32 palette as an xml file at:

<https://drive.google.com/file/d/15X4WADJHvql9dOCE09QeWI55ekHKLzCa/view?usp=sharing>

Convert the 256 entries color palette to the format of your choice (i.e. needed by your drawing software) using tools such as SwatchBooker, ColorZilla, Paletton, COLOURlovers, Chroma, Colormind, Colors, Adobe Color CC, to name a few.

It seems Corel PhotoPaint and PhotoShop [maybe others too] do not save the .bmp file in the expected Windows bmp header flavor (there are many choices). The [Irfanview](#) program does, so we recommend using this one.

Below are steps gathered from a Facebook link on how to create a custom boot or custom lock screen; Just follow these simple steps (remember you will need FW 4.0 at least) using Irfanview:

You'll need this software as it is free, and the easiest to use: [www.irfanview.net](http://www.irfanview.net)

- To generate the necessary colour palette, open the image customlock.bmp using the link provided above in this document.
- When opened, export the color palette (Left top on screen) Image -> Palette -> Export Palette. That's the most important step!!! Otherwise the console will not use the desired colors while locking.
- Load up any image (or create it) you'd like to have on your lock screen (please note that this works only with the USB stick containing the image plugged in. You can remove the stick when locked, but you'll need the drive everytime you lock it)
- For the lock screen, you can import any \*.bmp image (max resolution 799 x 399 pixels). If not already a 256 colors index file, you will need to convert it to 256 colors, such as by decreasing the colordepth to 256 colors (Image -> Decrease Color Depth)
- Next thing you'll need to do is convert the image to the colour palette you just generated: Image -> Palette -> Import palette.
- Make sure that the image's resolution doesn't exceed the maximum size of 799 x 399 pixels. You can resize it at "Image -> Resize Resample"
- Save the result as a BMP image, name it "CustomLock.bmp" and copy it to the root directory of your USB drive.

In order to create a custom boot image, just repeat these steps and rename the file to spell "CustomBoot.bmp".

## Appendix – X32/M32 Icons

X32/M32 Icons are numbered 01...74 and shown below.

## Appendix – X32 MIDI Implementation<sup>63</sup>

### MIDI RX > SCENES

Whenever program change messages in the range 1-100 are received on MIDI CH01, the corresponding cue/scene/snippet of the X32 internal show memory will be loaded.

#### General Notes and Requirements

Setup / remote

- MIDI In/Out check marks must be set according to the connection on which MIDI input will be accepted (via physical MIDI connectors on X32 or S16, or via USB expansion card)
- MIDI In/Out check mark must be set for “MIDI Receive Prog Change”

Setup / global

- When “Confirm Pop-Ups” or “Scene Load” is active, MIDI scene recalls will only become active after manual confirmation on the console
- If you prefer activating scenes via MIDI program changes immediately, un-check the “Confirm Pop-Ups” / “Scene Load” tick mark

Scenes View / home

- Valid cues/scenes/snippets must be stored to the internal X32 show file. It is not possible to recall empty scenes, snippets or cues via MIDI.
- The scope of changes applied by a MIDI scene recall depends on the Scene Safes, Parameter Safes and Channel Safes settings, as if the scene was recalled locally.

### MIDI TX > CUES

Every Cue can be assigned one specific MIDI command/event. Each time the Cue is loaded the MIDI command will be sent out once.

Possible choices for MIDI commands/events to be found on Scenes View/MIDI page:

- Off > no message will be sent upon scene load
- Program Change > select the MIDI Channel and the Program Number (using knobs 4/5 at the main display)
- Control Change > select the MIDI Channel, Controller number and value (using knobs 4-6 at the main display)
- Note > select the MIDI Channel, Note number and velocity (using knobs 4-6 at the main display)

will send out a Note On command directly followed by the same Note Off command

---

<sup>63</sup> This section is taken from the Behringer MIDI implementation document dated Sep. 18, 2017

### MIDI RX > ASSIGN

Whenever assignable controls are set up for transmitting MIDI commands, reception of that same command (status or continuous) will be reflected on the respective assignable control element (button light, encoder LED collar).

### MIDI TX > ASSIGN

We restricted the user assignable MIDI commands to some generic elements, in order to keep things simple enough:

Encoders 1-4 > can be assigned to sending control changes, program changes or notes

- parameters are currently 'Channel' and 'Value'
- for CC and Note commands 'Value' = controller number/note number, and the encoder rotation determines the controller value/note-on velocity
- for Program Changes only the channel is specified, and the encoder rotation determines the program number

Buttons 5-12 > can be operated in two modes, 'MIDI Push' (non-latching) for momentary commands, or 'MIDI Toggle' (latching) for static commands

#### MIDI Push:

- can be assigned to sending control changes, program changes or notes
- parameters are currently 'Channel' and 'Value'
- for CC and Note commands 'Value' 0...127 = controller number/note number, and the button momentarily toggles the controller value/note-on velocity
- to 127 (depressed/released]
- for Program Changes 'Value' 0...127 = program/preset number, that will be sent upon pressing the button

#### MIDI Toggle:

- can be assigned to sending control changes or notes
- parameters are currently 'Channel' and 'Value'
- for CC and Note commands 'Value' 0...127 = controller number/note number, and the button toggles the controller value/note-on velocity
- between value/velocity 127 and 0 with every operation

**Please Note:**

- The ASSIGN section also reflects/displays reception of the same MIDI commands that are selected for transmission
- The MIDI commands assigned to the ASSIGN controls can be transferred to and from stage via AES50 using the S16 stage box MIDI I/O

**MIDI RX/TX > DAW REMOTE CONTROL SURFACE**

Enables a specific form of bi-directional MIDI communication for remote controlling a computer DAW application using control elements of the X32 console. REMOTE can be used in 3 modes, Mackie Control, HUI and raw MIDI CC (raw) controllers (see Setup/remote)

MIDI CC (raw) selected and Remote is enabled+active, the group section controls will transmit/ receive the following messages:

| MIDITX           | Midi Ch | Controller | Comment                               |   |
|------------------|---------|------------|---------------------------------------|---|
| Group 1-8 SELECT | 1       | Note 64-71 | on (127) / off (0), push non-latching | Note that the exact button functions may vary from DAW to DAW |
| Group 1-8 SOLO   | 1       | CC 32-39   | on (127) / off (0), toggle latching   |   |
| Group 1-8 MUTE   | 1       | CC 40-47   | on (127) / off (0), toggle latching   |   |
| Sends On Fader   | 1       | CC 48      | on (127) / off (0), toggle latching   |   |
| Group DCA 1-8    | 1       | Note 72    | on (127) / off (0), push non-latching |   |
| BUS 1-8          | 1       | Note 73    | on (127) / off (0), push non-latching |   |
| BUS 9-16         | 1       | Note 74    | on (127) / off (0), push non-latching |   |
| MTX 1-6          | 1       | Note 75    | on (127) / off (0), push non-latching |   |
| GROUP Faders     | 1       | CC0-7      | 0-127                                 |   |

HUI selected and Remote is enabled+active, then the group fader section and buttons will emulate the HUI control surface protocol, i.e. for ProTools.

- SELECT/SOLO 1-8 buttons will select or solo the corresponding track in the DAW, in banks of 8 tracks
- Sends On Fader = enables touch-writing a fader automation on selected track, track automation mode in DAW must be 'touch', (latching)
- use the layer buttons to determine the function assigned to the MUTE 1-8 buttons, the LED displays indicate that function
  - Group DCA 1-8 = allows to move the bank selection of tracks in a DAW, (push non-latching)
  - BUS 1-8 = allows to set DAW tracks to 'Record Ready', (push non-latching)
  - BUS 9-16 = enables using the MUTE buttons for track mute in the DAW, (latching)
  - MTX 1-6 = enables using the MUTE buttons for transport controls in the DAW, (latching)

MACKIE CTRL selected and Remote is enabled+active, then the group fader section and buttons will emulate the Mackie Control Universal protocol

- SELECT/SOLO 1-8 buttons will select or solo the corresponding track in the DAW, in banks of 8 tracks
- Sends On Fader = enables touch-writing a fader automation on selected track, track automation mode in DAW must be 'touch' or 'latch', (latching)
- use the layer buttons to determine the function assigned to the MUTE 1-8 buttons, the LED displays indicate that function
  - Group DCA 1-8 = allows to move the bank selection of tracks in a DAW, (push non-latching)
  - BUS 1-8 = allows to set DAW tracks to 'Record Ready', (push non-latching)
  - BUS 9-16 = enables using the MUTE buttons for track mute in the DAW, (latching)
  - MTX 1-6 = enables using the MUTE buttons for transport controls in the DAW, (latching)

## Appendix – OSC over MIDI Sysex commands

Additionally to Behringer’s document/note “X32 MIDI Implementation” which provides an overview of the MIDI RX, TX and MIDI assignments applicable to X32/M32 systems, OSC commands can be sent to the device over MIDI, using Sysex messages. Make sure your MIDI connection or device will support sending SYSEX messages; some devices do not provide (full) SYSEX support.

The general format for sending OSC commands over MIDI Sysex is: `F0 00 20 32 32 <OSCtext> F7`

with `<OSCtext>` being the OSC command in text hex format, and up to 39 kbytes in length. The space character `0x20` is used as separator between command and data, as shown below. Parameter data are converted from int or float to their string equivalent, respecting known X32 values where appropriate. Enums are sent as strings too.

Examples: (~ stands for the NULL character, \0; data within brackets are sent as 32 bits big endian values). OSC below only applies to commands sent over ethernet; Sysex commands are to be sent over MIDI only.

Setting channel 01 mute ON (muting the channel):

OSC: `/ch/01/mix/on~~~,i~~[0]`

OSC: `/ch/01/mix/on~~~,s~~OFF`

`<OSCtext>: /ch/01/mix/on OFF`

Sysex: `F0 00 20 32 32 2F 63 68 2F 30 31 2F 6D 69 78 2F 6F 6E 20 4F 46 46 F7`

Unmuting channel 01:

OSC: `/ch/01/mix/on~~~,i~~[1]`

OSC: `/ch/01/mix/on~~~,s~~ON`

`<OSCtext>: /ch/01/mix/on ON`

Sysex: `F0 00 20 32 32 2F 63 68 2F 30 31 2F 6D 69 78 2F 6F 6E 20 4F 4E F7`

Setting channel 01, EQ 2 frequency to 1kHz (actually 1020Hz, due to known discrete values)

OSC: `/ch/01/eq/2/f~~~,f~~[0.57]`

`<OSCtext>: /ch/01/eq/2/f 1020`

Sysex: `F0 00 20 32 32 2F 63 68 2F 30 31 2F 65 71 2F 32 2F 66 20 31 30 32 30 F7`

Setting channel 01, dynamics Hold value to 100ms

OSC: `/ch/01/dyn/hold~,f~~[0.74]`

`<OSCtext>: /ch/01/dyn/hold 100`

Sysex: `F0 00 20 32 32 2F 63 68 2F 30 31 2F 64 79 6E 2F 68 6F 6C 64 20 31 30 30 F7`

Setting User Assign Bank C, button 5 to send MIDI note 3 on MIDI channel 5, as a MIDI push command

OSC: `/config/userctrl/C/btn/5~~~~,s~~MN05003~`

`<OSCtext>: /config/userctrl/C/btn/5 MN05003`

Sysex: `F0 00 20 32 32 2F 63 6F 6E 66 69 67 2F 75 73 65 72 63 74 72 6C 2F 43 2F 62 74 6E 2F 35 20 4D 4E 30 35 30 30 33 F7`

As a result, Bank C button 5 will generate the following two MIDI sequences: `94 03 7F` and `94 03 00`

Please refer to the OSC commands descriptions in this document for command formats and applicable ranges for their respective parameters’ types and ranges, and tables in appendix for corresponding floating-point data and X32/M32 known discrete values for different fields (EQ, Dynamics, Gate, etc).

## Appendix – Fader Floats Table – 1024 float values – [0.0, 1.0]

The data is presented as [fader index, float, float hex value, node value] quadruplets
